---

1. What Habitat is

A ship drops six colonists and a hold full of materials on an empty world, and you are the base's architect. You decide **where** things go, never **who** does what. The colonists walk out, take whatever work your buildings offer, and look after their own needs. If you place an oxygen generator with no power, nobody stops you: they suffocate.

The loop is: **place** → **produce** → **survive the night** → **call the next ship** → **place more.** Every building needs something another building makes, and the colony is always one broken link away from trouble. Habitat is modelled on *Planetbase* (Madruga Works, 2015), cut down to fit a Z80 and 128 KB.

There is no victory screen. A colony either goes on, or it does not.

2. What you need

- An **Amstrad CPC 6128** (the game needs all 128 KB) with its disc drive, or a CPC emulator set to a 6128.
- The game disc, `habitat.dsk`, an Extended DSK image (see the README for how it is built).
- **The game saves onto its own disc.** Use a copy, and do not write-protect it, or saving will fail with `DISC ERROR`.

3. Starting a game

Insert the disc and type:

```
RUN"HABITAT
```

After a few seconds the menu appears over a piece of a world, a different one each time.

The menu

CHOOSE A WORLD — move with the cursor keys or the joystick, and choose with `SPACE` or `ENTER` (or the joystick's fire). The line under the list describes the world:

Line	World
`RANDOM`	any of the four
`DESERT`	water, land, some ore
`ICE`	most water, some ore
`STORM`	mountains, ore, dry
`BARREN MOON`	dust, ore, little water
`TUTORIAL`	learn to build a colony (always the same barren moon)

Every choice except `TUTORIAL` builds a **new world** of that kind, generated from a random seed. The game loads, then builds the world in about five seconds, with a tune.

Loading

The game starts with nothing built: the six colonists stand outside beside the ship, in the middle of the map.

The start

The ship's hold brings **60 Water, 100 Food, 60 Ore, 189 Metal, 137 Bioplastic and 12 Spares**. The six are four workers, an engineer and a biologist. Their suits hold about ten minutes of air, so the first domes are urgent.

4. The screen

The top rows (the HUD):

```
O2 ██████ PWR+█████ H2O-███·· FOD ██····  FE189 BI137 PR  0 SP 12 ME  0 BO  0 $  0
6/6 SOL  0 DAY ALL SYSTEMS OK
```

- **Four bars:** oxygen (`O2`), power (`PWR`), water (`H2O`) and food (`FOD`). A bar turns **red below one quarter**.
- **Power and water are balances, as in Planetbase.** Their five cells are what is stored: the collectors' charge, and the water against the room there is for it. The sign before them says which way it is going, updated about every 20 seconds at normal speed:
  - `PWR+` while the colony makes at least the power it asks for, `PWR-` when it asks for more and the collectors run down;
  - `H2O-` when the water fell since the last update, or is running short (see section 11).
- **Six stocks:**
  - `FE` Metal;
  - `BI` Bioplastic;
  - `PR` Processors;
  - `SP` Spares;
  - `ME` Medicine;
  - `BO` Bots waiting to wake.
- `$` **coins**, which visitors pay.
- **Everything as a number** is on `V`, the resources page (section 11).
- **Colonists alive / cap** (`6/6`, `140/160`), the **sol** (day number), `DAY` or `NGT` (night).
- **The alert line**: the most urgent thing going on (section 14).

The play area shows 20 × 10 tiles of the world. The camera follows the cursor at the edges of the view.

The bottom rows:

- **The button bar** has six groups and help: `D` domes, `R` corridor, `P` power, `E` resources, `T` transport, `M` manage, `?` help. Inside a group the bar shows that group's buttons.
- **The key line** says what the keys do right now, for example `SPACE=MENU I=INFO COPY=FIT C=SHIP`.
- **The speed**: `PAUSE`, `x1`, `x2` or `x4`.
- **While building**, the two rows show the selection and its price, and whether it can be placed: `READY SPACE TO BUILD`, or the reason it cannot.

5. Controls

Everything has a key. The four directions and the two fire buttons also work on the joystick: its first fire is `COPY`, its second `ESC`.

Key	Action
Cursor keys / joystick	Move the cursor, one tile a press. Held, it moves again every fifth of a second. In a menu, left/right picks the item and up/down the room.
SPACE	Go to the button bar. Left/right picks a group, and SPACE opens it. It opens on the last group you built from, so SPACE SPACE returns to where you were. SPACE also places a building or a corridor, picks in a menu, calls the ship, makes a deal and picks a save slot.
COPY / fire 1	On a dome: open its machines (`FIT`). In `FIT`: put the machine in the slot. Everywhere else it does what SPACE does.
ESC / fire 2	Cancel, back.
The letter on a button	Press that button while it is on the bar. From the main view: `D R P E T M`.
? (the / key)	The help screen: every button with one line about it. Any key returns.
1 2 3 4	Speed: pause, normal, ×2, ×4. You can still build while paused.
`I`	Info: what is under the cursor.
`H`	Centre the view on the middle of the map, where the ship is.
`S` / `L`	Save / load, from the main view (section 15).
`C`	Call a colonist ship (section 12).
`G`	The milestones: all five, and how far the colony is from each (section 16). From the main view.
`TAB`	The world map. From the main view.
`V`	The resources: every stock as a number, red when short, green when plenty (section 11). From the main view, and in `M`.

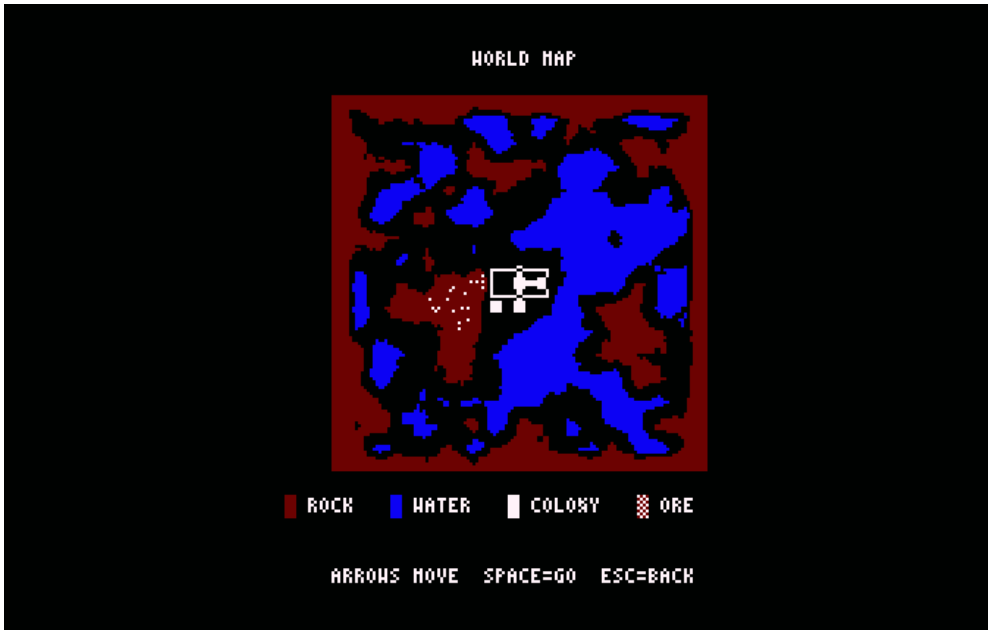

The help screen, on ?

The world map (TAB) shows the whole world on one page, one dot a tile:

- black is ground you can build on;
- brown is rock, mountains and craters, where nothing is built;
- blue is water;
- white is the colony: its buildings, corridors and paths;
- brown with white dots is an ore vein.

The frame is what the screen shows. The cursor keys move it, SPACE (or COPY) takes the view there with the cursor in the middle, and ESC (or TAB again) goes back to where you were. The game waits while the map is open.

The world map, on TAB

The buttons inside each group:

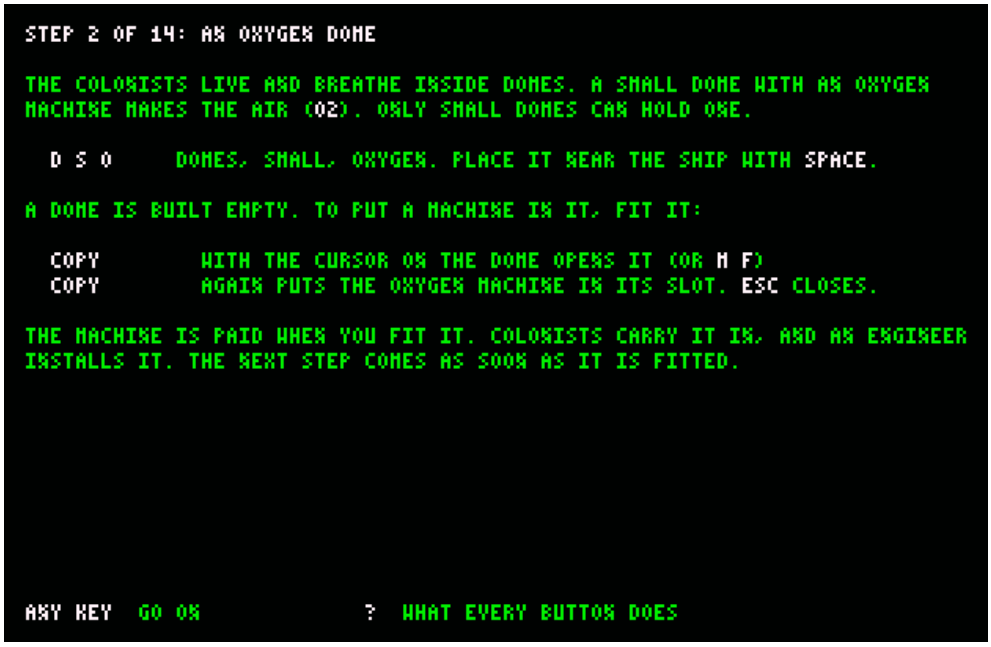

Group	Buttons
D DOMES	S small, M medium, L large; then the room: O oxygen, C canteen, Q quarters, G greenhouse, F factory, B lab, E medbay, N control, T storage, U lounge
R CORRIDOR	link two domes yourself
P POWER	S solar panel, T wind turbine, C collector
E RESOURCES	X extractor (water), M mine (ore)
T TRANSPORT	A airlock, P landing pad, C ship, M trade
M MANAGE	I info, F fit, S save, L load, H centre, D demolish, V all resources

A button drawn in red cannot be used right now. For example, TRADE is red while no merchant is at the pad.

6. Your first colony, step by step

This is the order the tutorial teaches, and a good opening on any world. The letters are the keys to press, starting from the main view.

#	Keys	Build
1	P S	a **solar panel**, then SPACE to place it
2	D S O	a small **oxygen dome**; then COPY on the dome, and COPY again to fit its OXYGEN machine
3	T A	an **airlock** by the dome: the only way in and out
4	E X	an **extractor** at the water's edge
5	D S C	a **canteen**, fitted with MEALS
6	P S	**another solar panel**
7	P C	a **collector**, to store power for the night
8	E M	a **mine**, on an ore vein if you can
9	D S F	a **factory**, fitted with METAL
10	D M G	a medium **greenhouse**, fitted with plants
11	D S B	a **lab**, fitted with MEAT
12	D S N	a **control room**
13	T P	a **landing pad**
14	C, SPACE	**call a colonist ship**

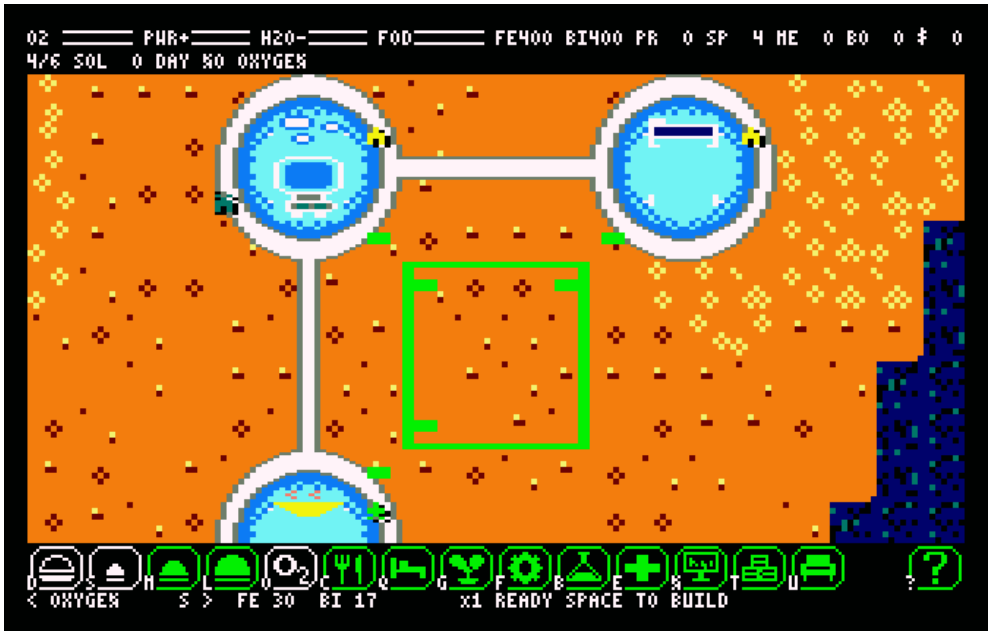

A tutorial page: step 2, the oxygen dome

The tutorial explains each step on a page of its own.

- Before anything else, a page about the screen: the bars, the stocks, the cursor and the buttons. Then step 1's page.
- When a step is done, the game stops and shows the next step's page: what to build, why the colony needs it, which keys to press, and what to watch. Any key goes back to the colony.
- The step's line stays under the buttons, and `?` shows its page again. A second `?` on the page shows what every button does.
- The pages are read from the disc (`TUTOR.TXT`), so leave the disc in the drive. Without it, the page says where it is.

A step is done as soon as its building is placed. There are no hazards until the ship has been called. Then a last page says `THE COLONY IS YOURS`, and it is a normal game, which you can save like any other.

7. Building

Placing a small dome: its outline is the ghost, green where it can go

How to place something:

1. Pick it from the button bar (for example `D S 0`).
2. A **ghost** of the building follows the cursor. It is green where the building can go, and red where it cannot, with the reason on the panel.
3. `SPACE` places it, and you are back in the main view: `SPACE SPACE` opens the same group again for the next one. `ESC` goes back without building.

What it costs:

- The panel shows the price in Metal (`FE`) and Bioplastic (`BI`), and a dome's price includes its corridors. It is **paid at placement**.
- Then the colonists **carry the materials** to the site, ten at a time.
- When everything has arrived, an **engineer** (or a constructor bot) builds it. If nobody can, the alert line says `NO ENGINEER`.

The rules of placement. Every building joins the colony when it is placed, within **12 tiles**. If it cannot join, its ghost is red and the panel says why.

- **A dome** gets a covered corridor to every dome within reach, up to four, and to any airlock that has no corridor yet. The first dome can go anywhere.
- **An airlock** is joined by a corridor to the nearest dome. The airlocks are the colony's only doors.
- **Everything outside** — panels, turbines, collectors, extractors, mines, the landing pad — is joined by a **path on the ground** to the nearest airlock or other structure. The first one needs nothing. Colonists walk those paths in their suits.
- The `R` button links two domes yourself. Pick the first dome, then the second (`PICK THE FIRST DOME`, `NO ROUTE FROM THERE`), and you are back in the main view.
- **Medium and large domes cannot hold oxygen.** Oxygen machines fit only in small domes.
- **The extractor needs water within two tiles** (`NEEDS WATER NEARBY`).
- **A mine off an ore vein digs at half speed.** The panel says `NO VEIN HALF ORE`, but you may still build it.

Messages you may see:

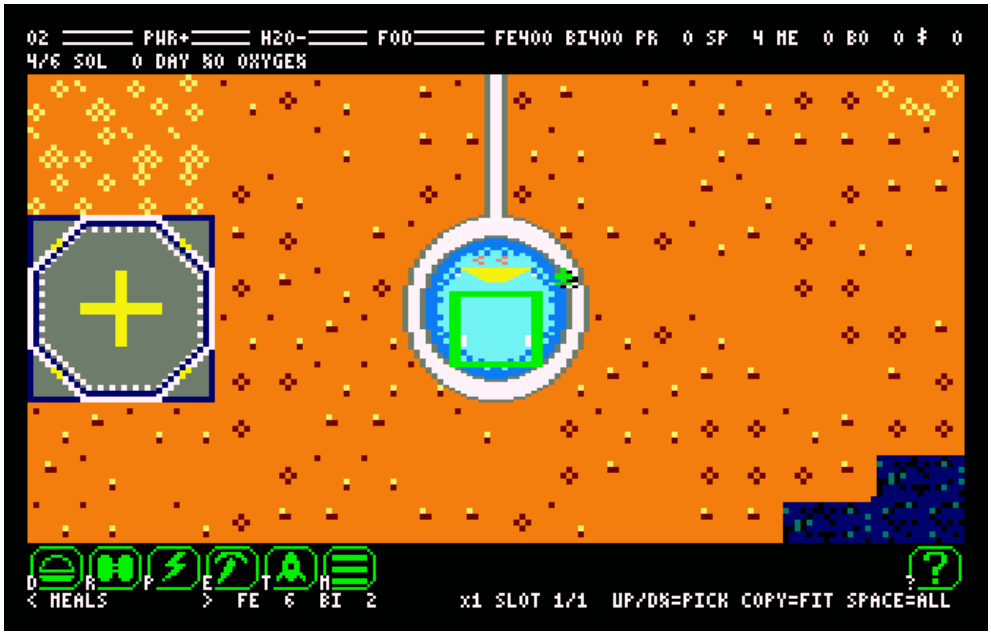

Message	Why
`BLOCKED`	the ground there is not buildable, or something stands in the way
`NOT ENOUGH MATERIAL`	not enough Metal or Bioplastic
`TOO FAR`	nothing it could join is within 12 tiles
`PATH BLOCKED`	a corridor or path cannot get through
`NO CORRIDOR FITS`	the two domes are almost diagonal to each other; move one a little
`NEEDS WATER NEARBY`	the extractor is not at the water
`NO VEIN HALF ORE`	the mine is allowed, at half yield

8. Domes, rooms and machines

A dome has a **size** and a **room**, chosen when you place it. The room cannot be changed afterwards.

Size	Footprint	Machine slots
small (`S`)	4 × 4 tiles	1
medium (`M`)	6 × 6	4
large (`L`)	8 × 8	8

A dome is built empty. To put machines in it, **fit** it:

Fitting a canteen: the slot has a box, the panel shows the machine and its price

- `COPY` on a dome (or `M F`) opens it.
- Left/right picks a slot, and up/down picks what goes in. The room's main machine comes first.
- `COPY` installs it, and `SPACE` puts the same machine in every slot, as far as the materials go. `ESC` closes.
- The box around the slot is green when you can pay for the machine, red when you cannot, and pink when it is already there.
- **Each machine is paid for when you fit it.** Its materials are then carried to the dome, and an engineer installs it. Until then it is drawn stopped, with a mark. Plants grow at once.

- Taking a machine out gives back **half** its price.
- You can fit a dome while it is still being built.
- Quarters, Storage and Lounge have no machines.

The rooms (the names are as they appear on screen):

Room	Machines	What it is for
OXYGEN (small only)	`OXYGEN`	Air for the colony, from Water and Power. One oxygen dome keeps about ten colonists breathing.
CANTEEN	`MEALS`	Meals from **Starch + Vegetables + Meat**, all three. Colonists eat and drink here.
QUARTERS	—	Beds: 2 / 6 / 12 by size.
GREENHOUSE	`STARCH`, `VEGGIES`, `HERBS`, `TREE`, `MIXED`	Plants. Herbs are for medicine. Trees keep morale up, and visitors pay more for them. `MIXED` plants a bit of everything.
FACTORY	`METAL`, `PLASTIC`, `SPARES`, `ROBOTS`, `WEAPONS`	Ore → Metal. Starch → Bioplastic. Metal + Bioplastic → Spares. Metal + Processors + Bioplastic → a Bot. Metal + Processors → Guns.
LAB	`MEAT`, `CHIPS`, `DRUGS`	Water + Power → Meat. Metal → Processors. Herbs → Medicine.
MEDBAY	`BEDS`, `CABINET`	Heals the sick, using Medicine.
CONTROL	`CHIPS`	Raises the colony's size by 48, and lets you call ships.
STORAGE	—	Room for 100 / 300 / 600 more goods by size.
LOUNGE	—	Keeps morale up, and visitors pay more.

Most machines need someone to work them. Workers run the machines, and biologists tend the plants. The more people stand in a dome, the more of its machines turn. The `OXYGEN` machine runs on its own.

The colony keeps some reserves by itself:

- the machines that use Metal (`SPARES`, `ROBOTS`, `WEAPONS`, `CHIPS`) stop while Metal is under 30;
- `PLASTIC` stops while Bioplastic is at 100 or more;
- `SPARES` stops at 20 Spares.

Building, fitting and trading are never limited by these.

9. Outside the domes

Structure	What it does
SOLAR PANEL	Power by day. Nothing at night or in a sandstorm.
WIND TURBINE	Power from the wind, day and night.
COLLECTOR	Stores the day's spare power for the night.
EXTRACTOR	Water from the ground, beside water.
MINE	Ore. 1–3 people dig: more diggers, more ore. **Your colony's first mine is free.** The mine holds up to 6 ore of its own, then stops; the 6 are carried to storage or to the ship in one trip, and it fills again.
AIRLOCK	The way in and out.
LANDING PAD	Ships land here. You need one for every kind of ship.

Outside, colonists breathe from their suits.

- A suit holds about ten minutes of air at the start. After that it holds about three minutes a trip, refilled free every time they go out.
- With under a minute left the alert line says `SUIT AIR LOW` and they head back.
- **When a suit is empty, the colonist dies.**

Keep airlocks close to the structures people work at.

10. Colonists and bots

Five specialties, shown on the ship's line as:

- `WRK` worker: runs machines, digs, carries;
- `ENG` engineer: builds, installs machines, repairs;
- `BIO` biologist: tends greenhouses;
- `MED` medic: heals;
- `GRD` guard: fights intruders.

Anyone can carry materials. Nobody takes orders: they take the work the buildings post, the most urgent first, from the nearest.

Six needs:

- **Oxygen.** Inside, from the colony's air. Outside, from the suit.
- **Water and food**, at a canteen.
- **Sleep**, in quarters.
- **Health**, healed in a medbay with Medicine.
- **Morale.** Lounges, trees and visitors raise it, and deaths lower everyone's.

When a need runs low, a colonist drops their work and goes to see to it. If the canteen is on the far side of the base, you will watch production stop for the walk.

Bots are made by the `ROBOTS` machine. Each one goes into the Bots stock (`BO`) and wakes at a factory with a `ROBOTS` machine, up to sixteen. A bot becomes a constructor, a carrier or a driller, as the colony needs. Bots do not breathe, eat or sleep. You can also buy them from a merchant.

The colony holds up to **160 colonists** and **16 bots**. Its size starts at 6 and grows by 48 with each Control room: 54 with one, 102 with two, 150 with three, and the full 160 with four.

11. Power, air, water, food, storage

- **A sol** (a day) lasts four minutes at normal speed, and about 40% of it is night.
- **Power.** Panels give nothing at night. A collector carries the colony through it, and turbines turn in the dark.
  - When power runs short the colony sheds load, in steps: the mines, factories and gardens stop first, then the extractors, and the oxygen machines last. The battery feeds the machines and the extractors only while it keeps enough for the oxygen through a night. The line says `LOW POWER` while load is shed.
  - With no power at all it says `NO POWER`: the machines stop, then the oxygen.
- **Water.** The extractors fill it up to 600, and each Storage dome adds room for water too, 100, 300 or 600 by size. This is apart from the goods' store below.

    - When water runs short it is kept for the air. Below one and a half units per colonist the greenhouses and the meat printer (`MEAT`) stop.
    - Below one unit per colonist nobody drinks at the canteen, and visitors get no meal.
    - The oxygen machines drink to the last unit.
- **Air.** Without enough oxygen machines, or without power or water for them, the line says `NO OXYGEN` and health drains fast.
- **Food.** A canteen's `MEALS` machine feeds about six colonists, and it needs Starch, Vegetables and Meat together. The greenhouse makes the first two and the lab the third.
- **Storage.**
    - Until you build a Storage dome, the ship's hold is your store: 750 for everything but Water.
    - Each Storage dome adds 100, 300 or 600 by size.
    - When the store is full the line says `STORAGE FULL`. The greenhouses stop, except for whichever of Starch, Vegetables and Meat is scarcest.
    - The mines and the meat printer (`MEAT`) do not stop at once: each fills its own store first, 6 ore at a mine and 3 meat at the machine, and then stops. As soon as there is room again, what they hold goes into the store and they fill up again.

The resources page (`V` from the main view, or `M V`) shows every stock as a number, with power, oxygen and the store. The game waits while it is open, and any key goes back. The numbers are coloured by the game's own limits:

- **red**: the colony is short, and something stops or an alert comes soon;
- **green**: plenty, or a machine has stopped because there is enough;
- **white**: enough. The names, the bots, the colonists and the coins are always white.

Stock	Red below	Green from
Water	1½ per colonist (the greenhouses and `MEAT` stop)	¾ of the room for it
Meals	1 per colonist (`LOW ON FOOD`)	3 per colonist
Starch, Vegetables, Meat, Metal, Bioplastic	30	100
Spares	4	20 (SPARES stops)
Ore	10	100
Processors, Medicine, Guns, Herbs	1	10
Power stored	while the HUD says `PWR-`	`PWR+` and ¾ full
Oxygen made	what the colony breathes (`NO OXYGEN`)	a quarter more
Store	full (`STORAGE FULL`)	under half full

The page is read from the game's disc, like the milestones' page, so the disc must be in the drive.

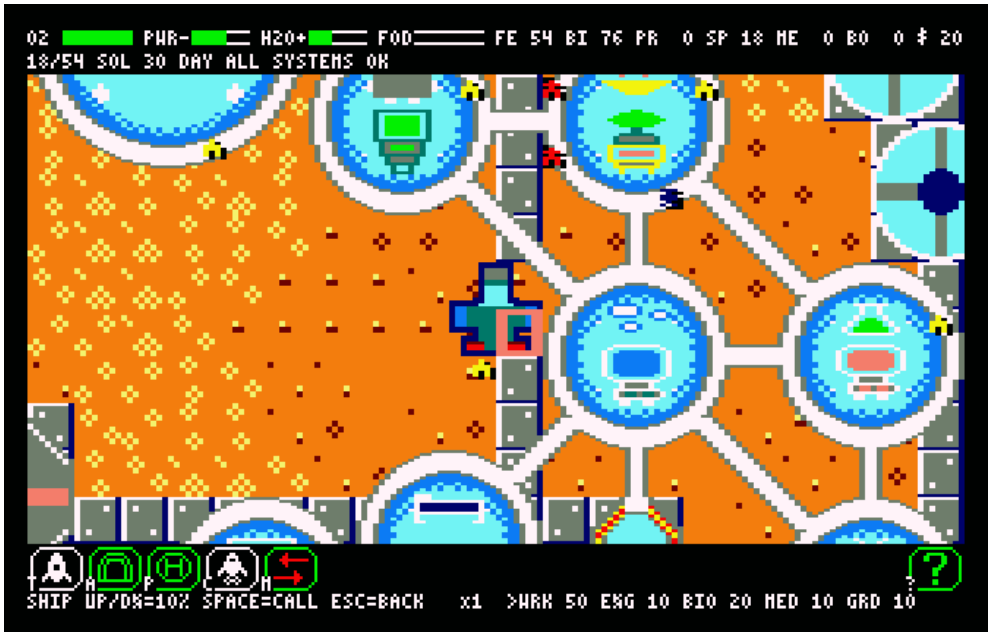

The resources page, on V

12. Ships: colonists, visitors, merchants, intruders

All ships land on the **landing pad**, one at a time.

Colonist ships come when you call them.

- They need a **Control room** and a **landing pad**.
- `C` (or the `SHIP` button) opens the ship's line:

The ship's line

- Left/right picks a specialty, and up/down moves its share in steps of 10%. The shares always add up to 100.
- `SPACE` calls the ship. It comes down a few seconds later with **four colonists**, each of the specialty your colony lacks most against the shares.

- The messages: `NEED A CONTROL ROOM`, `NEED A LANDING PAD`, `A SHIP IS ALREADY DUE`, `COLONIST SHIP CALLED`.

Visitors come on their own, and more often as the colony's **prestige** grows.

- Two to five land and walk to a canteen to eat and drink, paying **5 coins** each, and 3 more if you have a lounge or trees. Then they visit a lounge, if there is one, and walk back to their ship.
- With no canteen, food or water they leave hungry, and the colony's goodwill falls.
- **Prestige** grows with the colony's milestones, with the colonists alive, with sols without a death, with lounges and trees, and with goodwill.

A merchant lands about every 2.7 sols and stays half a sol. The line says `MERCHANT LANDED`, and `T M` (the `TRADE` button) opens the trade line:

```
+40% TAKE  210 GIVE  250 SPACE=DEAL
 <METAL  > SHIP 20 TAKE 10 HAVE  75 @ 15
```

- Left/right walks through the goods, the merchant's own first.
- **Up** takes one more lot, and **down** gives one more.
- The top line weighs what you take, at the merchant's prices, against what you give, at their value. `SPACE` makes the deal when you give at least as much as you take.
- **One deal per visit.** Colonists and carrier bots carry the goods to and from the pad, and the merchant leaves when they are done.
- Coins can be traded too.

Intruders. Once the colony has 20 colonists, about one landing in eight brings two to four intruders.

- They look like colonists in red. The line says `INTRUDERS`.
- Everyone outside heads in through the nearest airlock, and the guards fight.
- At the alert each guard takes a Gun from the store, if there is one, and keeps it. With a Gun a guard hits twice as hard, and can also shoot into the next dome or structure.

13. Hazards

Hazard	What it does	What helps
Night	no solar power	collectors, turbines
Malfunction	a machine stops dead (`BROKEN` and its name)	an engineer and **one Spare** per repair
Sandstorm	no solar power, and anyone outside is hurt	turbines, collectors, staying inside
Solar flare	three machines stop at once	Spares, engineers
Meteor shower	eight impacts round one building: structures are knocked back to sites, machines stop, craters appear	spread-out building, Spares, builders
Intruders	they strike whoever stands in front of them	guards, Guns

Malfunctions come from the first sol. Sandstorms, flares and meteor showers start once the colony has 20 colonists, and come at least two sols apart. A broken machine shows a red mark until it is repaired. One still waiting to be installed shows a different mark.

14. The alert line

The line shows the most urgent message, in this order:

Message	Meaning
`NO POWER`	No power at all: machines stop, then oxygen.
`NO OXYGEN`	Life support is short. Health drains fast.
`INTRUDERS`	Someone is being attacked.
`SUIT AIR LOW`	Someone outside has less than a minute of air.
`LOW POWER`	Load shed: mines, factories and gardens are stopped. The oxygen runs, and the extractors while there is power for them.
`METEOR SHOWER`	Impacts are falling now.
`LOW ON FOOD` / `LOW ON WATER`	Less than one portion per colonist left.
`NO ENGINEER` …	Something waits to be built or installed, and nobody alive can do it. The line names what waits.
`BROKEN` …	A machine waits for its repair. The line names the machine.
`SANDSTORM`	A sandstorm is blowing.
`STORAGE FULL`	Production that adds to the store has stopped. Mines and the meat printer fill their own 6 and 3 first.
`MERCHANT LANDED`	A merchant is at the pad.
`COLONY LOST`	Everyone is dead.
`ALL SYSTEMS OK`	Nothing to report.

15. Info, demolition, speed, saving

- **Info** (`I`, or `M I`): what is under the cursor — the building, its state (`SITE` or `ACTIVE`), its condition (`HP`), and the ground (`GROUND`, `DUST`, `ROCK`, `MOUNTAIN`, `WATER`, `ORE VEIN`…). On a working mine it also shows the ore the mine holds: `ORE 4/6`.
- **Demolish**: put the cursor on the building, then `M D` and `SPACE`.
  - It works on domes and structures, finished or not. A dome's corridors go with it.
  - **The ship** can come down once you have a finished airlock and a Storage dome. Until then `D` opens a red `DEMOLISH`, and its line says what is missing: `NEEDS AIRLOCK`, `NEEDS STORAGE` or `NEEDS AIRLOCK + STORAGE`. With both, the line says `LEAVES 150 FE + 100 BI FOR 10 SOLS`.
    - The ship becomes a pile of crates in its place.
    - Your workers carry them to storage, ten at a time and Metal first.
    - Whatever is still there after 10 sols is lost.
    - `I` on the crates shows what is left and how many sols remain.
    - The hold's 750 stays after the ship is gone.
  - While a ship is due or at the pad, the pad and the Storage domes cannot be demolished.
  - You get back **half** of what the building, its corridors and its machines cost. A site that was never finished gives everything back.
  - Whoever is inside walks out.
- **Speed**: `1` pause, `2` normal, `3` ×2, `4` ×4. At ×4 the screen may skip frames, because the simulation does four times the work. Paused, you can still look around and build.

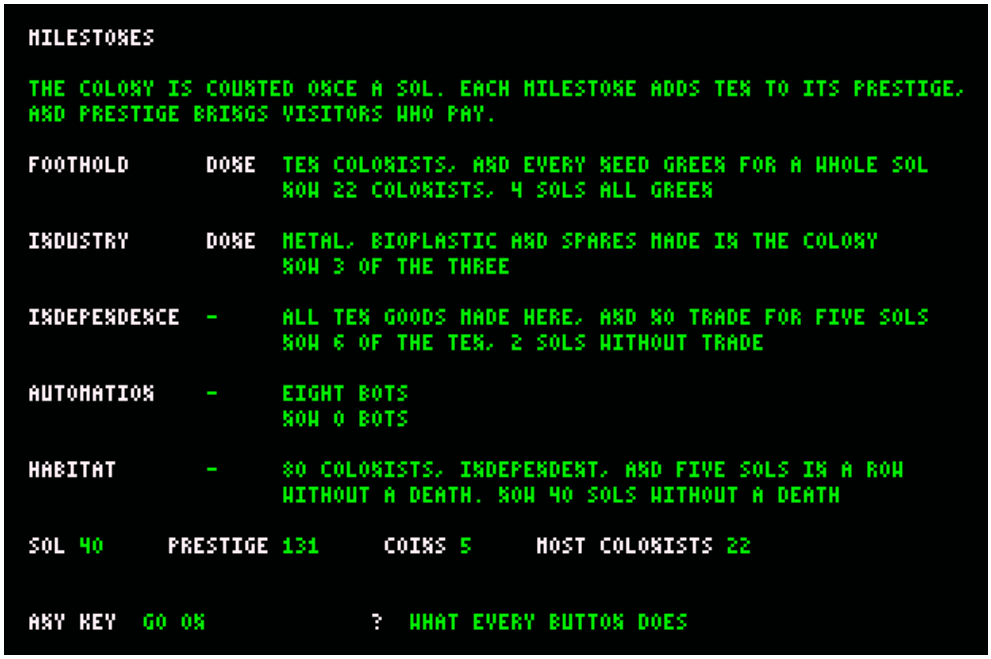

- **Saving and loading** (`S` / `L` from the main view, or `M S` / `M L`):
  - Left/right picks one of **three slots**, `SPACE` goes, and `ESC` backs out.
  - The messages: `SAVING TO DISC...`, `SAVED TO SLOT 1`, `LOADING FROM DISC...`, `LOADED FROM SLOT 1`, `NOTHING IN SLOT 2` (an empty slot), `DISC ERROR`.
  - Saves are written to the game disc.

16. Goals, and losing

There is no victory screen. The game counts five **milestones** once a sol, and they raise the colony's prestige, which brings visitors:

Milestone	What it takes
Foothold	10 colonists, all needs green for one sol
Industry	Metal, Bioplastic and Spares made in the colony
Independence	all ten goods made in the colony, and no trade for five sols
Automation	8 bots
Habitat	80 colonists, independent, five sols in a row with no deaths

- **When a milestone is reached**, a page says so, what it adds, and what the next one asks. The game waits for a key. If you are placing a building, the page comes as soon as you are back on the main view. Two milestones at once are two pages.
- `G`, from the main view, shows all five: `DONE`, or what each one asks and how far the colony is from it (colonists, sols all green, goods made here, sols without a trade, bots, sols without a death). Under them are the sol, the prestige, the coins and the most colonists so far.

G: the milestones

The colony is lost only when everyone is dead (`COLONY LOST`). A colony of two with no power is still alive, and saving it is the point.

When the last colonist dies, the page COLONY LOST shows the sols lived, the most colonists, the prestige, the coins and the milestones reached:

- L loads a saved colony, with the slot chooser of section 15.
- **Any other key starts a new colony from the menu.** The game disc must be in the drive.
- After ESC in the slot chooser you stay with the dead colony, and G shows the page again.

The end of a colony

17. Tips

- **Power first, then air.** The tutorial's second solar panel and its collector before the first night are there for a reason.
- **One oxygen dome for about every ten colonists.** Keep it powered and supplied with water.
- **Meals need all three foods.** A greenhouse alone, or a lab alone, will not feed anyone.
- **Keep Spares in store.** Every repair takes one, and a broken OXYGEN machine with no Spares can kill a large colony. Build a SPARES machine early: it stops by itself at 20.
- **Keep the canteen close to where people work.** Hungry colonists drop their work to walk to it.
- **Build airlocks near the structures outside.** Every trip is spent in a suit.
- **Add Storage before the store fills.** A full store stops the greenhouses, and the mines once each holds its 6.
- **Call ships when there is room, food and air for them.** Four colonists arrive at once.
- **Spread out the domes** once the colony passes twenty: meteor showers strike round one building.

18. Limits worth knowing

- Only **eight domes of each room** count for the colony's searches. A ninth canteen or quarters is never chosen for a need, and a ninth Storage adds no room. Its machines still run.
- A new dome gets corridors to **at most four** domes.
- Two domes almost diagonal to each other cannot be joined (`NO CORRIDOR FITS`). Move one by a tile or two.
- Colonists walking outside are drawn on top of whatever they pass.
- The colony holds 160 colonists and 16 bots.
